

# Wet soils will cause you issues all season long! Monty's has a solution!

## Problem.

This spring, your soils have been flooded or heavily saturated, creating anaerobic conditions which suppress the important soil biology in your soil needed for nutrient conversion and root development. And you have not had a chance to make your burn down or pre-plant application.

## Solution.

Apply Monty's Liquid Carbon with your burn down or pre-plant application this spring to help rejuvenate your soil and maximize yields!

## Benefits.

Monty's Liquid Carbon (MLC) reduces soil compaction, enhances micronutrient uptake, stimulates microbial activity, and improves the overall health of your soil. Applying 2 quarts of MLC during burn down or at pre-plant will help all of your crops this wet season!

In addition, adding a pint of Bio-Strain or an ounce of Multiplicity to your tank-mix will help replenish beneficial microbes that have been lost due to these saturated conditions. MLC can also be applied with your first herbicide pass on soybeans.

**Ask your dealer or Monty's representative how applying Monty's Liquid Carbon to your spring applications can help improve the health of your soil and increase your yield!**
