

IS YOUR SOIL HEALTHY ENOUGH FOR NEXT SEASON'S CHALLENGES?

Remediation today is the key to a successful yield next season!

This season, growers around the country saw one challenge after another including salt build-up, tied-up nutrients, and disease and insect pressures. The sooner you can address these issues, the sooner your yield potential can be stabilized and damage can be minimized. By next spring you will be on your way to healthier soils and higher yields!

Monty's offers a trio of humic-based products – Monty's Liquid Carbon, Humi-Till, and Humihance – designed to help address these challenges this fall. Whether you want to focus on the health of your soil, crop residue, performance of your fertilizer, or just want to increase your ROI next season, Monty's trio of products can help.

Ask your representative how to prepare your soils today for greater success next season!

Monty's offers solutions this fall for healthier crops next season.

Issues: Soil compaction, residue build-up, high salt levels, tied-up and imbalanced nutrients, and herbicide carry-over.

Monty's Liquid Carbon is a unique, activated humic technology designed to reduce compaction and improve overall soil health (including texture, structure, and performance). MLC releases micronutrient tie-ups, and helps break down plant residue. Also available in dry format!

> Apply at 2-quarts per acre*

Issues: Residue build-up, especially from stacked hybrids; soil compaction; mold, fungi, and disease carry-over; high salt levels; tied-up and imbalanced nutrients; and herbicide carry-over.

Humi-Till is a unique blend of specific microbes and activated humics designed to decompose crop residue. Digesting residue helps eliminate the mold, fungi, and disease that exists on the residue. Humi-Till significantly reduces your planting problems and makes the nutrients in crop residue available. Works great on all types of residue including corn, wheat, soybeans, cotton, peanuts and canola.

> Apply at 4 quarts per acre*

Issues: All nitrogens (dry or liquid), as well as phosphorus and potash, have high salt indexes. These high indexes contribute to issues with germination and root development. The heavier the application of fertilizers, the greater the negative impact on the soil and biology.

HUMIHANCE is a humic-based fertilizer coating that addresses fertilizer salt indexes by coating each granular with Monty's activated humic substances. Humic substances buffer fertilizer salt, reducing damage to seed germination and root development. Humihance is designed to increase the efficiency of each fertilizer granular. It is ideal for use when blending granular fertilizer, and is compatible with micronutrients and pre-treated fertilizers. Non-corrosive. Contains 1% Nitrogen.

> Apply at 1/2 gallon per ton of fertilizer*

* Available in 2.5, 30, 275 gallon - and bulk sizes. Please check with your dealer for availability and application rates.
